ASSOCIATED GAS SOLUTIONS

The option to release gas to the atmosphere by flaring or venting is a necessary practice in the production of oil and gas. Yet recent changes in environmental rules, new technologies, and a vibrant trading market for natural gas and condensate encourage the recovery of these gases.

Our goal is to capture, utilize and monetize this once nonmarketable gas.

“Nearly 33% of natural gas produced did not make it to market.”

-ND Dept. of Mineral Resources

Associated Gas Solutions

- Tank Emissions Management
- Flaring Alternatives
- Onsite Power Generation
- Gas Lift Operations
- Pump Jacks
- Metering (AGA Methods)
- Custody Transfer
- Compressor Selection
- Utilize Well Head Gas As A Fuel Source
- Maximize Condensate Recovery And Run Time
- Engineering Audits
- Gas Capture Plan

Multifaceted Approach

An efficient associated gas system typically results in more products to sell thus resulting in a financial benefit. Research indicates the lost potential revenue to the industry adds up to \$1.4 million each day. However, no single solution is appropriate for all clients, projects or locations. Fuel, feedstock or reinjection? Through engineering studies and packages to compression technologies, our team will work with you to design the right system for your operation.

At GCC we understand that associated gas is just one aspect of a complex compression facility. From operations, maintenance and design we offer a full range of solutions and proven applications to streamline and simplify every stage of your process. Our experts provide a comprehensive review and offer a variety of creative and common sense approaches to address your specific needs.

To discuss a customized solution contact Andrew Harrah at 303.325.2075 or aharrah@gccinc.us.
